For Controlling PC

List of Commands:

- **culprit** → Takes a pic using the camera of the laptop and sends it to the app. (to see if someone is using the PC without your permission).
- **lock** → Locks the current session running on the system.
- **unlock** → Unlocks the current session if it is locked previously.
- **super unlock** → Unlocks the system in all possible scenarios and also resets all the sessions of currently running apps. Also unlocks the PC, if it has just booted.
- **reboot** → Reboots the system.
- **shutdown now** → Shutdowns the system.
- **systemctl suspend** → Puts the pc to sleep.
- **requestSysActivity** → Sends all the important PC info to the app. The information includes the MAC-Address, Ram, SSID, Charging status, etc.
- **DISMISS** → Turns off the service running in your PC. After this you have to restart the service manually.
- **ss** → Takes a screenshot of the PC and sends it to the App.

In addition to these specialized commands, you can also pass any commands which you would normally pass into the terminal CLI.

NOTE:- All these commands are just extra features. Other than this you can use any command that belongs to that particular system, while these commands are for all Linux distros and come with COGU predefined.

For Controlling Appliances:

List of commands:

- **iot echo** → All connected devices will echo their names.
- **iot list** → This will give the list of all connected devices on the channel. To be run after `*iot echo*` command.
- **iot<device name><pin no.>{on, off}** → This command will turn the appliance on or off.

NOTE:-
All the commands are case sensitive.
